# Test Report

# Listen Before Talk (LBT)

Test of Canopy PMP450i AP - 0a-00-3e-45-11-78, 3.6GHz MIMO OFDM 11/21/2016

The unrestricted contention based protocol for devices operating in the 3650-3700 MHz under Part 90Z of the FCC rules permit operation on a co-channel with like systems (similar systems) and unlike systems.

# 1. Customer Information

| Company name: | Cambium Networks Ltd.      |  |
|---------------|----------------------------|--|
| Address:      | 3800 Golf Road, Suite 360, |  |
|               | Rolling Meadows,           |  |
|               | IL 60008                   |  |
|               | United States of America   |  |

# 2. Summary of Testing

#### 2.1 General Information

| Specification Reference:  | Section 90.7 of Part 90 of the US FCC rules                         |  |
|---------------------------|---|--|
| Specification Description | A protocol that allows multiple users to share the same spectrum by |  |
| of Contention Based       | defining the events that must occur when two or more transmitters   |  |
| Protocol (CBP):           | attempt to simultaneously access the same channel and               |  |
|                           | establishing rules by which a transmitter provides reasonable       |  |
|                           | opportunities for other transmitters to operate. Such a protocol    |  |
|                           | may consist of procedures for initiating new transmissions,         |  |
|                           | procedures for determining the state of the channel (available or   |  |
|                           | unavailable), and procedures for managing retransmissions in the    |  |
|                           | event of a busy channel.  |  |
|                           | The 'Listen Before Talk' (LBT) operational procedure is the most    |  |
|                           | well-known Contention-based Protocol (CBP)                          |  |
| Test Dates:               | From 27 September till 30 September 2016                            |  |

#### 2.2 Summary of Test Results

| Reference                    | Part    | Measurement                         | Result |
|------------------------------|---------|-------------------------------------|--------|
| Section 90.7 of US FCC rules | Part 90 | Verification of Unrestricted        | PASSED |
|                              |         | Contention Based Protocol operation |        |

#### Notes:

- 1) The Device Under Test (DUT) is operating in OFDM mode in the 3.65 3.70 GHz frequency band.
- 2) The DUT was operating in the following channel bandwidth: 20 MHz.

## 2.3 Methods and procedures

| Reference: | Section 90.7 of Part 90 of the US FCC rules |
|------------|---|
| Title:     | Private land mobile radio services          |

# 3. Equipment Under Test (EUT)

#### 3.1 Identification of Equipment Under Test (EUT)

| Brand Name:                           | Cambium Networks                      |
|---------------------------------------|---------------------------------------|
| Model Name:                           | Canopy 450i 3.6GHz MIMO OFDM - Access |
|                                       | Point                                 |
| MAC Address:                          | 0a-00-3e-45-11-78                     |
| Hardware Version Number (Board Type): | P13                                   |
| Software Version Number:              | 14.3 (Build 9) AP-None                |

#### 3.2 Description of EUT

The device under test was a Point to Multipoint (PMP) Access Point

#### 3.3 Modifications Incorporated in the EUT

No modifications were made to the EUT during testing.

#### 3.4 Additional Information Related to Testing

| Technology Tested:                 | Unrestricted Contention Based Protocol operation: Listen |                                  |  |
|------------------------------------|--|----------------------------------|--|
|                                    | Before Talk  |                                  |  |
| Type of Unit:                      | Access Point   |                                  |  |
| Modulation:                        | OFDM   |                                  |  |
| Antenna Gain:                      | 17 dBi (90° sector)                                      |                                  |  |
| Power Supply Requirement:          | Nominal  | 30.0 V, CMM3 & CMM4, 802.3af PoE |  |
|                                    |  | Supply                           |  |
| Transmit & Receive Frequency       | 3650 MHz to 3700 MHz                                     |                                  |  |
| Range:                             |  |                                  |  |
| Channel Bandwidth:                 | 20 MHz   |                                  |  |
| Transmit & Receive Channel Tested: | Channel Frequency (MHz): 3660, 3675, 3690                |                                  |  |

#### 3.5 Support Equipment

The following support equipment was used to exercise the EUT during testing:

| Description:          | 450i Subscriber Module               |
|-----------------------|--------------------------------------|
| Brand Name:           | Cambium Networks                     |
| Model Name or Number: | Canopy 3.6GHz MIMO OFDM – Subscriber |
|                       | Module                               |
| MAC Address:          | 0a-00-3e-40-6b-3f                    |

| Description:          | 450 Access Point                     |  |
|-----------------------|--------------------------------------|--|
| Brand Name:           | Cambium Networks                     |  |
| Model Name or Number: | Canopy 3.6GHz MIMO OFDM – Subscriber |  |
|                       | Module                               |  |
| MAC Address:          | 0a-00-3e-40-30-bd                    |  |

| Description:          | AC/DC Power Supply Unit |
|-----------------------|-------------------------|
| Brand Name:           | Phihong                 |
| Model Name or Number: | PSA 15R-295(MOT)        |

| Ì | Serial Number: | P81000498A1 |
|---|----------------|-------------|
| , |                |             |

| Description: AC/DC Power Supply Unit |                  |
|--------------------------------------|------------------|
| Brand Name:                          | Phihong          |
| Model Name or Number:                | PSA 15R-240(MOT) |
| Serial Number:                       | P74215491A1      |

| Description:          | scription: Laptop Computer |  |
|-----------------------|----------------------------|--|
| Brand Name:           | HP Compaq                  |  |
| Model Name or Number: | 85010w                     |  |
| Serial Number:        | CNU8311Z1P                 |  |

| Description:          | ption: Laptop Computer |  |
|-----------------------|------------------------|--|
| Brand Name:           | Dell Latitude          |  |
| Model Name or Number: | D600                   |  |
| Serial Number:        | 2CCHQ31                |  |

#### 4. Operation and Monitoring of the EUT during Testing

#### 4.1 Operating Modes

The EUT was tested in the following operating modes, unless otherwise stated

- The EUT was tested as a Master unit connected to a Slave transmitting on full power using OFDM modulation as the manufacturer declared that as a representative modulation mode for LBT testing and further declared that the modulation mode used would not impact the results.
- The EUT has two receive channels which normally connect to vertically and horizontally polarized antennas.
- Here is the list of frequencies the DUT is operating.

| Bandwidth, | Lower frequency, | Middle frequency, | Upper frequency, |
|------------|------------------|-------------------|------------------|
| MHz        | MHz              | MHz               | MHz              |
| 20         | 3660             | 3675              | 3690             |

- The device was tested with different power level depending on the channel bandwidth and EIRP power limit.
- The LBT detection threshold is based on the following equation:

LBT Detection Threshold (dBm) = -73 dBm/MHz +  $10*\log$  (BW) +  $23 - P_T + A$ , where

BW is the channel bandwidth value;

 $P_{T}$  is the sum of the conducted transmit power Pc and the transmit antenna gain A; A is the antenna gain.

- The device was tested with different power level for each bandwidth and antenna gain of 0 dBi. Therefore the target LBT Detection Threshold is following:
  - for BW = 20 MHz: Detection Threshold = -73 + 13 + 23 25 = -62 dBm (-65 dBm per chain);
- The device was tested with different power level for each bandwidth and antenna gain of 17 dBi. Therefore the target LBT Detection Threshold is following:

for BW = 20 MHz: Detection Threshold = -73 + 13 + 23 - 25 + 17 = -45 dBm (-48 dBm per chain);

#### 4.2 Configuration and Peripherals

The EUT was tested in the following configurations(s):

- All measurements were made using a conducted link. The antenna ports gave independent access to horizontal and vertical antenna connections;
- A laptop PC was used to configure the EUT parameters during the testing using a standard web browser and via SSH. The laptop was connected to the EUT via Ethernet to set EUT parameters;
- The EUT's command line interface was used to report radar detection events;
- When the system required channel loading a UDP data stream with predefined parameters was generated with iperf network testing tool. This stream was transferred from the laptop, connected to the master device (AP) to the laptop, connected to the slave device (SM).

# 5. Measurements, Examinations and Delivered Results

#### **5.1 Test Results**

Test Summary: CW signal was used as an interferer for unlike systems

| Test Engineer:           | Pavel Polyakov    | Test Dates: | 27 September 2016 |
|--------------------------|-------------------|-------------|-------------------|
| Test Sample MAC Address: | 0a-00-3e-45-11-78 |             |                   |

#### **Environmental Conditions:**

| Temperature (°C):      | 27.6 |
|------------------------|------|
| Relative Humidity (%): | 32   |

Results: 20 MHz bandwidth, power level 25 dBm and antenna gain 0 dBi

| Test # | Frequency (MHz) | Channel Bandwidth (MHz) | Unwanted Signal Level (dBm) | TX Off |
|--------|-----------------|-------------------------|-----------------------------|--------|
| 1      |                 |                         | -72                         | No     |
| 2      |                 |                         | -71                         | No     |
| 3      |                 |                         | -70                         | No     |
| 4      |                 |                         | -69                         | No     |
| 5      | 3660            | 200                     | -68                         | Yes    |

| 9     |                 |                         | -50                         | Yes    |
| 10    |                 |                         | -49                         | Yes    |

Comment: red line (1) – interferer signal is turned on, green line (2) – interferer signal is turned off, blue line (3) – the connection between the AP and SM is restored.

Test Summary: OFDM signal from the similar AP was used as an interferer

| Test Engineer:           | Pavel Polyakov    | Test Dates: | 30 February 2014 |
|--------------------------|-------------------|-------------|------------------|
| Test Sample MAC Address: | 0a-00-3e-45-11-78 |             |                  |

#### **Environmental Conditions:**

| Temperature (°C):      | 27.6 |
|------------------------|------|
| Relative Humidity (%): | 32   |

450 Access Point that was used as a source of interference was configured to have 20 MHz channel bandwidth and 50/50 Downlink/Uplink ratio. With 2.5 ms frame the interfering signal is supposed to be turned on 50 % of the time, i.e. 1.25 ms. However, measurements showed that the actual 'on time' is less than that. Based on the calculations the time that the TX is open is 42.86 %. Please see the screenshot below:

Taking in consideration the fact that the Access Point is not transmitting 100 % of the time the tme domain correction factor should be taking into the account whilst calculating the detection threshold. This correction factor is calculated based on the following equation:

Factor=10\*log10(Duty Cycle), for this particular case the correction factor is 10\*log10(0.43)=-3.68 dB. Therefore all the threshold calculated earlier goes up by 3.68 dB.

Results: 20 MHz bandwidth, power level 25 dBm and antenna gain 20 dBi

| Test | Frequency | Channel Bandwidth | Antenna Gain | Unwanted Signal | TX  |
|------|-----------|-------------------|--------------|-----------------|-----|
| #    | (MHz)     | (MHz)             | (dBi)        | Level (dBm)     | Off |
| 1    | 3660      | 20                | 0            | -68 dBm         | No  |
| 2    | 3660      | 20                | 0            | -67 dBm         | Yes |
| 3    | 3675      | 20                | 0            | -68 dBm         | No  |
| 4    | 3675      | 20                | 0            | -67 dBm         | Yes |
| 5    | 3690      | 20                | 0            | -68 dBm         | No  |
| 6    | 3690      | 20                | 0            | -67 dBm         | Yes |
| 7    | 3660      | 20                | 17           | -50 dBm         | No  |
| 8    | 3660      | 20                | 17           | -49 dBm         | Yes |
| 9    | 3675      | 20                | 17           | -49 dBm         | No  |
| 10   | 3675      | 20                | 17           | -48 dBm         | Yes |
| 11   | 3690      | 20                | 17           | -50 dBm         | No  |
| 12   | 3690      | 20                | 17           | -49 dBm         | Yes |

# **Appendix 1: Test Equipment Used**

| Manufacturer            | Description                                     | Model  | Date Calibration Due |
|-------------------------|---|--------|----------------------|
| Agilent<br>Technologies | MXA Signal Analyzer 20 Hz – 8.4 GHz             | N9020A | 14 May 2018          |
| Agilent<br>Technologies | PSG Analog Signal Generator 250 kHz –<br>50 GHz | E8257D | 17 Dec 2016          |

Note: all cables, splitter and attenuators that were used for test setup were preliminary calibrated.

#### **Appendix 2: Monitoring Methods Diagrams**

All tests were performed as conducted measurements using the setups as shown below.

Setup Diagram – EUT – Master, CW signal Injection at Master. Client Device acts as a Slave Device for this scenario.

Note: for the test when a similar Canopy AP was used as an interferer, the CW Signal Generator was substituted for this AP for unlike system.
